

6 SYSTEMS

The STURDOS range of pumps allows complete dosing systems to be integrated using plug-and-play solutions that include all the necessary accessories to ensure quick, safe, and reliable installation. These systems can be manufactured in PVC, PP, PVDF, or stainless steel, offering maximum chemical compatibility and adaptability to the conditions of each process.

The frames can be supplied in an open structural format or in a cabinet with doors, depending on the level of protection required. The polypropylene or polyethylene version adds extra safety, preventing any pressure projections resulting from a malfunction from reaching operators and facilitating the containment of unwanted spills.

In terms of control, the systems can be equipped with both junction boxes and control cabinets in different materials. In addition, it is possible to integrate PLCs to meet advanced automation and control specifications, offering a solution that is fully adapted to the operational needs of each customer.

With these options, STURDOS provides robust, versatile dosing systems that are ready for the most demanding industrial requirements.
